1	NCT05546229	Assessment of Methadone and Buprenorphine in Interstitial Fluid Study Documents:	Title Acronym: Other Ids: 1332356 5R44DA044905-03 (U.S. NIH Grant/Contract)	Recruiting	Opioid Use Disorder	Procedure: Microneedle based interstitial fluid collection Interstitial fluid will be collected from the skin using microneedles and suction.	Study Type: Observational Phase: Study Design: Observational Model: Case-Only Time Perspective: Prospective Primary Outcome Measures: *Same as current* Secondary Outcome Measures: *Same as current*	Actual Enrollment: Estimated Enrollment: 22 Original Estimated Enrollment: *Same as current* Age: 18 Years and older (Adult, Older Adult) Sex: All	Study Sponsors: *Same as current* Collaborators: • National Institutes of Health (NIH) • National Institute on Drug Abuse (NIDA)	Study Start: September 14, 2022 Primary Completion: October 15, 2022 (Final data collection date for primary outcome measure) Study Completion: October 30, 2022 First Posted: September 19, 2022 Results First Posted: Last Update Posted: September 19, 2022
2	NCT03573349	Ketamine Associated ACC GABA and Glutamate Change and Depression Remission: Study Documents:	Title Acronym: Other Ids: 17-011373	Enrolling by invitation	• Major Depressive Disorder • Treatment Resistant Depression • Bipolar Depression	Drug: Ketamine We will enroll 20 adults (aged 18-65 years) with treatment-resistant depression and will provide two i.v. ketamine infusions (0.5 mg/kg, infused over 40 minutes) and measure their depressive symptom responses. Biomarkers will be developed using blood samples from study subjects, taken prior to (predictive biomarkers), and following ketamine treatment (change biomarkers). This will be an open-label feasibility trial.	Study Type: Interventional Phase: Early Phase 1 Study Design: Allocation: N/A Intervention Model: Single Group Assignment Masking: None (Open Label) Primary Purpose: Treatment Primary Outcome Measures: Glutamate [Time Frame: 1 day] Evaluate change in central glutamate and peripheral glutamate with MRS after a single 40-minute infusion of i.v. racemic ketamine Secondary Outcome Measures: Mood [Time Frame: 1 day] Measure the change in depression symptoms using MADRS scale in participants with treatment-resistant major depression before receiving and 24 hours after the Ketamine infusion	Actual Enrollment: Estimated Enrollment: 20 Original Estimated Enrollment: 10 Age: 18 Years to 65 Years (Adult, Older Adult) Sex: All	Study Sponsors: *Same as current* Collaborators: Not Provided	Study Start: January 3, 2019 Primary Completion: December 2023 (Final data collection date for primary outcome measure) Study Completion: December 2023 First Posted: June 29, 2018 Results First Posted: Last Update Posted: September 14, 2022

3	NCT03492177	A Clinical Study of to Confirm the Doses of Selexipag in Children With Pulmonary Arterial Hypertension Study Documents:	Title Acronym: Other Ids: AC-065A203 2018-000145-39 (EudraCT Number) AC-065A203 (Other Identifier: Actelion)	Active, not recruiting	Pulmonary Arterial Hypertension	Drug: selexipag (Uptravi) Film-coated tablets for oral administration Other Names: • ACT-293987 • JNJ-67896049	Study Type: Interventional Phase: Phase 2 Study Design: Allocation: N/A Intervention Model: Single Group Assignment Masking: None (Open Label) Primary Purpose: Treatment Primary Outcome Measures: Area under the plasma concentration-time curve over a dose interval at steady state of selexipag and ACT-333679 combined (AUC,ss, combined) [Time Frame: PK sampling at Week 1 (or Week 12) at pre-dose, 1, 2, 4, 6, 8, and 12 post-morning dose as well as Weeks 2, 4 and 6 (prior to morning dose)] The AUC,ss,combined is the sum of the selexipag and ACT-333679 exposures weighted by their potency ratio, and determined during the 12 weeks up-titration period. The model will describe the body weight dependence of dose-exposure relationship for pediatric PAH patients. Blood samples for pharmacokinetic analyses will be collected in the 3 age cohorts. Secondary Outcome Measures: • Area under the plasma concentration-time curve over a dose interval at steady state (AUC,ss) of selexipag [Time Frame: PK sampling at Week 1 (or Week 12) at pre-dose, 1, 2, 4, 6, 8, and 12 post-morning dose as well as Weeks 2, 4 and 6 (prior to morning dose)] The AUC,ss for selexipag is calculated by non compartmental analysis to determine the total exposure to selexipag over a dosing interval • Area under the plasma concentration-time curve over a dose interval at steady state (AUC,ss) of ACT-333679 [Time Frame: PK sampling at Week 1 (or Week 12) at pre-dose, 1, 2, 4, 6, 8, and 12 post-morning dose as well as Weeks 2, 4 and 6 (prior to morning dose)] The AUC,ss for ACT-333679 is calculated by non compartmental analysis to determine the total exposure to ACT-333679 over a dosing interval • Maximum observed plasma concentration (Cmax,ss) of selexipag at steady state [Time Frame: PK sampling at Week 1 (or Week 12) at pre-dose, 1, 2, 4, 6, 8, and 12 post-morning dose as well as Weeks 2, 4 and 6 (prior to morning dose)] Cmax,ss of selexipag is directly obtained from the selexipag concentrations measured in the blood samples collected after at least 3 days on the same dose in order to reach steady state • Maximum observed plasma concentration (Cmax,ss) of ACT-333679 at steady state [Time Frame: PK sampling at Week 1 (or Week 12) at pre-dose, 1, 2, 4, 6, 8, and 12 post-morning dose as well as Weeks 2, 4 and 6 (prior to morning dose)] Cmax,ss of ACT-333679 is directly obtained from the ACT-333679 concentrations measured in the blood samples collected after at least 3 days on the same dose in order to reach steady state • Time to the maximum observed plasma concentration (tmax,ss) of selexipag at steady state [Time Frame: PK sampling at Week 1 (or Week 12) at pre-dose, 1, 2, 4, 6, 8, and 12 post-morning dose as well as Weeks 2, 4 and 6 (prior to morning dose)] tmax,ss of selexipag is directly obtained from the selexipag concentrations measured in the blood samples collected after at least 3 days on the same dose in order to reach steady state • Time to the maximum observed plasma concentration (tmax,ss) of ACT-333679 at steady state [Time Frame:	Actual Enrollment: 63 Estimated Enrollment: Original Estimated Enrollment: 55 Age: 2 Years to 17 Years (Child) Sex: All	Study Sponsors: *Same as current* Collaborators: Not Provided	Study Start: July 23, 2018 Primary Completion: April 18, 2022 (Final data collection date for primary outcome measure) Study Completion: December 9, 2026 First Posted: April 10, 2018 Results First Posted: Last Update Posted: September 14, 2022

	NCT Number	Title	Other Names	Status	Conditions	Interventions	Characteristics	Population	Sponsor/Collaborators	Dates
4	NCT05414084	Aggregate Metabolic Phenotypes for (Poly)Phenols: Development of an Oral (Poly)Phenol Challenge Test (OPCT) Study Documents:	Title Acronym: Other Ids: 1352/2020/SPER/UNIPR	Recruiting	• Individual Variability in (Poly)Phenol Metabolism • Cardiometabolic Health	Dietary Supplement: Oral (poly)phenol challenge test (OPCT) Nutritional challenge with standardized (poly)phenol-rich tablets	Study Type: Interventional Phase: Not Applicable Study Design: Allocation: N/A Intervention Model: Single Group Assignment Masking: None (Open Label) Primary Purpose: Screening Primary Outcome Measures: *Same as current* Secondary Outcome Measures: • Assessing common cardiometabolic health biomarkers in blood samples [Time Frame: Baseline] Samples will be processed for the analysis of common biomarkers of cardiometabolic health: total cholesterol (mg/dL), HDL-cholesterol (mg/dL), triglycerides (mg/dL), glucose (mg/dL), insuline (uUI/mL). Analyses will follow standardised routine procedures. • Assessing risk prediction scores [Time Frame: Baseline] Risk prediction scores (i.e., Framingham General Cardiovascular Risk Score, Framingham Heart Study Primary Risk Functions for heart disease, stroke, diabetes, fatty liver disease, and hypertension, Atherosclerotic Cardiovascular Disease (ASCVD) Risk, QRISK3®, QDScore®, Finnish Diabetes Risk Score (FINDRISC)) will be assessed to understand their relationship with the aggregate phenolic metabotypes observed. The higher the scores, the worse the risk of developing the disease. • Evaluating trimethylamine N-oxide (TMAO) in urine and plasma samples [Time Frame: Baseline] TMAO will be quantified in baseline urine and fasting plasma samples by UHPLC-MS/MS. • Evaluating eicosanoids in urine samples [Time Frame: Baseline] Eicosanoids, including prostaglandins, thromboxanes, leukotrienes, isoprostanes and neuroprostanes will be evaluated in baseline urine samples (0-h) by UHPLC-QqQ-MS/MS. • Assessing DNA oxidation catabolites and branched fatty acyl esters of hydroxyl fatty acids (FAHFAs) in plasma samples [Time Frame: Baseline] DNA oxidation catabolites and FAHFAs will be measured in fasting plasma samples by UHPLC-QqQ-MS/MS. • Determining genetic differences among subjects [Time Frame: Baseline] Genotyping will be conducted using genome wide, SNP array approach untargeted methodology, using commercially available SNP arrays and a tSNP approach. This approach will involve the genotyping of approximately 300 SNPs. Genomic DNA will be prepared from PBMCs isolated from blood samples. • Assessing transcriptomic signatures in peripheral blood mononuclear cells (PBMCs). [Time Frame: Baseline] Specific patterns of gene expression related to each metabotype will be investigated in PBMCs by using a microarray-based approach. Analysis will be carried out in a subset of 10 samples for each metabotype. • Determining gut microbiota composition and functionality in fecal samples [Time Frame: Baseline] Microbial profiling will be assessed by shallow shotgun metagenomics. Full shotgun metagenomics analysis will be carried out to determine functional pathways. • Assessing dietary habits [Time Frame: Baseline]	Actual Enrollment: Estimated Enrollment: 300 Original Estimated Enrollment: *Same as current* Age: 18 Years to 74 Years (Adult, Older Adult) Sex: All	Study Sponsors: *Same as current* Collaborators: • Azienda Ospedaliero-Universitaria di Parma • University of Birmingham • Centro de Edafología y Biología Aplicada del Segura (CEBAS-CSIC)	Study Start: May 31, 2022 Primary Completion: April 2023 (Final data collection date for primary outcome measure) Study Completion: April 2023 First Posted: June 10, 2022 Results First Posted: Last Update Posted: September 16, 2022

7	NCT03218761	POTS NET mRNA Functional Correlation With NET Activity Study Documents:	Title Acronym: Other Ids: IRB#170714	Enrolling by invitation	Postural Tachycardia Syndrome	• Diagnostic Test: NET mRNA level quantification of mRNA to the Norepinephrine Transporter (NET) • Diagnostic Test: Plasma catechols plasma for assay of norepinephrine (NE), DHPG (intraneuronal metabolite of NE), and other catechols • Diagnostic Test: Urine Catechols urine for assay of norepinephrine (NE), DHPG (intraneuronal metabolite of NE), and other catechols	Study Type: Observational [Patient Registry] Phase: Study Design: Observational Model: Cohort Time Perspective: Prospective Primary Outcome Measures: *Same as current* Secondary Outcome Measures: *Same as current*	Actual Enrollment: Estimated Enrollment: 200 Original Estimated Enrollment: *Same as current* Age: 13 Years to 80 Years (Child, Adult, Older Adult) Sex: All	Study Sponsors: *Same as current* Collaborators: • National Institute of Neurological Disorders and Stroke (NINDS) • University of Calgary • Dysautonomia International	Study Start: July 14, 2017 Primary Completion: December 31, 2025 (Final data collection date for primary outcome measure) Study Completion: December 31, 2025 First Posted: July 17, 2017 Results First Posted: Last Update Posted: September 14, 2022
8	NCT05041348	Metabonomic of Patients With Hepatitis B Cirrhosis Complicated With Sarcopenia. Study Documents:	Title Acronym: Other Ids: QYFYWZLL26461	Completed	Sarcopenia	Diagnostic Test: CT at the level of the third lumbar vertebra (L3) Muscle mass loss was defined as an skeletal muscle mass index (SMI) less than 46.96 cm²/m² for males and less than 32.46 cm²/m² for females	Study Type: Observational Phase: Study Design: Observational Model: Case-Control Time Perspective: Cross-Sectional Primary Outcome Measures: • amino acids [Time Frame: 2021.09.01-2022.08.01] Amino acids, especially BCCAs, is involved in muscle protein synthesis. So it is important for maintaining and increasing muscle mass . The concentration(μmol/L) of amino acids in the blood will be different in the three groups, especially amino acids associated with muscle metabolism. • myostatin [Time Frame: 2021.09.01-2022.08.01] increased myostatin levels contribute to muscle loss. So the concentration(pg/mL) of myostatin predicts to be higher in the sarcopenia patients. Secondary Outcome Measures: Not Provided	Actual Enrollment: 60 Estimated Enrollment: Original Estimated Enrollment: 90 Age: 18 Years to 60 Years (Adult) Sex: All	Study Sponsors: *Same as current* Collaborators: Not Provided	Study Start: August 17, 2021 Primary Completion: July 15, 2022 (Final data collection date for primary outcome measure) Study Completion: August 17, 2022 First Posted: September 13, 2021 Results First Posted: Last Update Posted: September 15, 2022
